

PROJECT TRANSFORMATION INSTRUCTION

You are acting as Senior Product Architect + Senior Full Stack Engineer.

IMPORTANT

- **DO NOT** create a project from scratch.
- **DO NOT** rebuild architecture from zero.

I already have an existing project.

Existing Project — Audio Transcriber and Summarizer

Current Features Already Implemented

Feature	Status
Audio upload	Done
Audio storage	Done
Speech-to-text transcription	Done
Transcript history	Done
AI-generated summaries	Done
Backend APIs	Done
Frontend UI	Done
Authentication structure	Done
Database setup	Done
Existing folder structure	Done
Existing React frontend	Done
Existing Node/Express backend	Done

☐ **Your Task**

Transform and evolve the existing application into:

SalesCall AI

An AI-powered Sales Call Assistant integrated with CRM + HRMS + KPI + KRA + OKR concepts.

This is a **product transformation**, not a fresh build.

- Preserve existing code where possible
 - Refactor intelligently
 - Reuse components, APIs, schemas, and UI
 - Avoid duplicate implementations
 - Follow **Lean methodology**
 - Extend gradually
-

☐ System Flow

Current Flow

```
graph TD; A[Upload Audio] --> B[Transcribe]; B --> C[Generate Summary]; C --> D[Save History];
```

New Flow

```
graph TD; A[Upload Sales Call] --> B[Transcribe]; B --> C[Identify Speakers]; C --> D[Analyze Conversation]; D --> E[Extract Customer Information]; E --> F[Generate Summary]; F --> G[Generate Tasks]; G --> H[Update CRM]; H --> I[Update KPI]; I --> J[Update OKR]; J --> K[Dashboard Analytics];
```

Product Goal

Convert a general-purpose transcription platform into a **business intelligence tool for sales teams**.

The assistant should:

Listen → Understand → Extract → Analyze → Recommend → Update Business Systems Automatically

☐ Refactor Strategy

Reuse Existing

- Audio upload module
- Transcription APIs
- History module
- Summary APIs
- Authentication
- Database setup
- Frontend layout
- Existing components
- Existing backend structure
- Existing AI service architecture

Only modify where necessary. Avoid deleting working code. Extend functionality.

Existing Feature Mapping

Old Feature	New Feature
Audio Upload	Sales Call Upload
Transcript	Speaker-separated sales transcript
Summary	Sales summary + action items
Transcript history	Customer interaction timeline
Audio analysis	Sales intelligence engine

New Modules to Add

Add these modules **incrementally**. **Do NOT build all at once**.

#	Module
1	CRM
2	KPI
3	KRA
4	OKR
5	Call Intelligence
6	Analytics Dashboard
7	AI Coaching

☐ CRM Module

Create Lead Management

Schema:

- Lead Name
- Email
- Phone
- Company
- Source
- Assigned Salesperson
- Lead Score
- Call History
- Status
- Follow-up date

Stages:

Lead → Contacted → Demo → Negotiation → Won / Lost

Connect call recordings to leads.

☐ Sales Call Analysis

Current transcription pipeline already exists. **Extend it.**

After transcript generation, run AI analysis and extract:

- Customer Name

- Company
- Pain Points
- Budget
- Urgency
- Timeline
- Competitors
- Sentiment
- Objections
- Requirements
- Next Action
- Meeting Date
- Follow-up Date

Store as structured JSON.

☐ AI Output Format

```
{  
  "customerName": "",  
  "company": "",  
  "painPoints": [],  
  "budget": "",  
  "sentiment": "",  
  "urgency": "",  
  "nextAction": "",  
  "followupDate": "",  
  "objections": []  
}
```

☐ Summary Upgrade

Current summary exists. Upgrade into:

- Executive Summary
- Bullet Summary
- Action Items
- Key Moments
- Customer Requirements
- Meeting Decisions
- Follow-up Suggestions

☐ Task Extraction Engine

Automatically detect:

Phrase Detected	Action Created
"Send proposal"	Create proposal task
"Call Friday"	Schedule call task
"Schedule meeting"	Create meeting task

Create CRM tasks automatically.

☐ Lead Scoring

Rules

Event	Score
Meeting booked	+30
Positive sentiment	+20
Budget discussion	+20
Urgent requirement	+20
Negative sentiment	-10

Auto-calculate score.

Score Brackets

0	-	30	→	☐	Cold
31	-	70	→	☒	Warm
71	-	100	→	☐	Hot

☒ KPI System

Track automatically:

- Calls completed
- Meetings booked
- Conversion rate
- Revenue generated
- Lead closure

Automatically update KPI values.

KRA System

Sales KRA:

- Lead generation
- Communication
- Follow-up quality
- Deal closure

Managers can assign KRAs.

OKR System

Objective: Increase Sales Performance

Key Results:

- Generate 500 leads
- Close 80 deals
- Improve retention by 20%

Employee activity should automatically update progress.

Analytics Dashboard

Reuse existing dashboard UI. Add:

- Total Calls
 - Lead Conversion
 - Call Quality
 - Salesperson Rankings
 - KPI progress
 - OKR progress
 - Revenue trends
-

☐ AI Coaching Feature

Generate post-call coaching:

Output:

- Strengths
- Weaknesses
- Suggestions

Examples of insights:

- "Customer interrupted often"
 - "Budget discussion too late"
 - "Weak objection handling"
-

🗃 Database Additions

Keep existing collections. Add only:

```
Leads
CallAnalysis
KPIs
KRAs
Objectives
KeyResults
Tasks
Notifications
```

📱 UI Instructions

Reuse current UI architecture. **Do not redesign entire application.**

Keep:

- Sidebar
- Theme
- Authentication flow
- History structure

Only extend pages. Maintain consistency.

📌 Development Order

Work **incrementally**. Do not replace working systems. Build on top of existing functionality.

Step 1	→	Audit existing project structure
Step 2	→	Identify reusable modules
Step 3	→	Create CRM schema
Step 4	→	Extend transcript pipeline
Step 5	→	Add AI extraction
Step 6	→	Add lead scoring
Step 7	→	Add KPI / KRA
Step 8	→	Add OKR
Step 9	→	Dashboard analytics
Step 10	→	AI coaching
